

# Protecting SQL Server, Oracle, and DB2

Hot database backup for business-critical operations

- ✓ Brick-level backup of SQL Server, Oracle, and DB2
- ✓ Hot backup (servers remain up 24x7 and backups occur while servers are up)
- ✓ Does not require an agent on the server machine, resulting in reduced “soft” costs and easier administration
- ✓ No additional license fees
- ✓ Can backup multiple database servers across a large LAN, all controlled from a single point
- ✓ With optional bandwidth throttling and local-restore options, large amounts of data can be backed up without impacting your other operations
- ✓ Backup the entire Exchange database (see MLR datasheet for Message Level Restore)
- ✓ WAN optimized with data de-duplication, block-level incremental backup and compression to reduce the amount of data transmitted to vault
- ✓ Advanced security and authentication algorithms, including AES encryption (up to 256), ensure the safety and confidentiality of backed up data in-flight and at-rest
