

About CRC

Every day more than 800 companies rely on CRC Data Protection to safeguard their critical business data. With more than two decades of experience in information management and security, we are experts in mission-critical data operations. Located in Alpharetta, Georgia, our 32,000 sq. ft. headquarters features high-tech training facilities, the latest security advances and many other features to help us better serve our CRC clients and strategic partners.

CRC partners with leading companies like Dell, Verizon and Microsoft to ensure robust data protection. Our data is synchronized between two fully-redundant secured data centers in real time via Cisco® Secure Virtual Private Network, with regular NetSec® assessments, redundant PIX® firewalls, and intrusion detection systems for comprehensive security. The CRC client interface features SSL encryption and we offer up to 256-bit AES encryption for data transfer and storage.

MS Small Business Server 2003 Backup/Recovery

The Data Protection Solution for Small & Mid-Level Enterprises

In today's knowledge-based economy, you can't afford to lose the crucial business information stored on the hard drives of your company's computers. True, Microsoft Windows Small Business Server 2003 (MS-SBS) includes a utility you can use to regularly backup your files, email messages and website. It has limitations, however.

For one thing, you can only back up information that resides on the MS-SBS host machine itself. Data stored on PCs and laptops across your LAN also need to be protected as they contain information that's crucial for your day-to-day operations, as well as legal compliance.

Traditionally, you back up to a tape drive, a process that requires an ongoing investment in time, training, technology and supplies. Managing storage of tapes offsite is a chore, and restoring data lost between storage periods is difficult. Bottom line, traditional offsite backup with tape is expensive, time-consuming and unreliable.

Now there's a more effective solution!

CRC DataProtection for Microsoft Windows Small Business Server 2003 automatically and securely backs up all your data - data that resides on every machine on your LAN. And it backs it up directly to the offsite storage vault of CRC DataProtection.

No time-consuming manual programs. No tapes to manage or store. No expensive tape hardware to maintain. You can back up more often, to minimize data loss between runs. Recovering lost data quickly, either over the Internet or with a Local Restore Appliance.

Best yet, the software is free! You pay only for the total amount of data you need to protect.

Fast, easy installation: With CRC's unique agentless technology, there's just one free software application to install on your MS-SBS host machine.

All your data is protected: The fully automated process backs up every machine you choose to protect, across your LAN, using your existing Internet connection to take data offsite securely.

Lower backup costs: You pay only for the total aggregate amount of data protected - no matter how many machines you are protecting.

Lower admin costs: Eliminates many costs associated with technology and tape storage. Upgrades are silent and automatic, without user intervention.

Service Level Agreement accountability: On-line reports ensure that pre-negotiated SLAs with CRC are being met. You'll know your backups were successful - or why they weren't.

Fast and efficient data recovery: Restore critical data quickly from CRC's secure offsite vault.

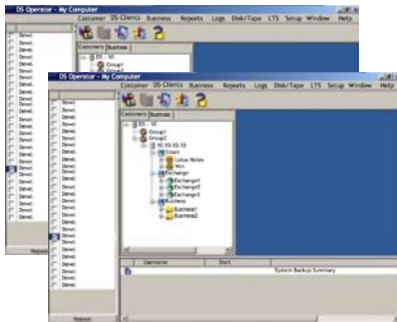

Data security: Advanced security and authentication algorithms, including AES encryption, ensure the safety and confidentiality of your data at all times.

This comprehensive solution protects all MS-SBS data types, including:

- **Windows Server 2003**
- **Microsoft SQL Server 2000**
- **Microsoft ISA Server 2000**
- **Microsoft Exchange Server 2003**

Now there's a new bottom line. Simpler administration. Lower backup overhead. The peace of mind that comes from knowing that your business is fully disaster recovery ready. Automatically.

Lower Backup/Restore Costs

Eliminate the "soft" (hidden) costs associated with tape backup:

- **Tape technology upgrades or replacements**
- **New and replacement tapes**
- **Offsite tape storage**
- **Training staff**

Protect data across your LAN

With CRC's unique agentless technology, you can protect data on the MS-SBS server, and every other machine on your LAN, including workstations, laptops, other Windows servers, other operating systems (e.g. NetWare, Linux). One free piece of software on your MS-SBS server will protect your entire LAN, without installing an agent on each target machine you want to protect!

Faster Backup

The heart of the CRC DataProtection solution is the CRC Client, software that runs on the same host machine as Windows Small Business Server 2003. It automates and simplifies the backup process as much as possible.

Back up as often as you choose. Incremental backups, down to the block file level, significantly reduce the amount of data transmitted. The CRC Client further reduces data transmission by eliminating common files across your entire LAN, and compressing your data before it's encrypted and transmitted off site.

Faster Recovery

You can recover any file generation (point-in-time) to the original location, or any alternate location you choose. You can store your data online, or request it from CRC on CD, tape or any other media, and store the latest generation locally. You can even automatically send your data to deep archive (for regulatory purposes) after a pre-specified time period.

Protect your laptops, too

You can also run the free CRC-Client Lite software on your laptops. You'll receive just one consolidated bill from CRC each month, covering all of your company's data. Backup just doesn't get simpler than that.

Built-in security and confidentiality

A high level of data security is a key element in our CRC Client design. Your data is stored offsite in encrypted format. For added security, all encryption and decryption takes place at your premises. CRC DataProtection never escrows your encryption key.

Software and Hardware requirements

The included DS-Client software runs on the same host machine that runs your Windows Small Business Server 2003. CRC DataProtection transmits data offsite securely using your existing Internet connection.
