

# Continuous Data Protection

Event-based real-time backup to eliminate data loss for Windows, Linux, and Microsoft Exchange environments

## Key Benefits

- Recovery times change from hours or days to seconds or minutes
- Restore data from an infinite number of Recovery Point Objectives
- CDP operations are not effected by small recovery and file restoration tasks
- No additional charge- included as a feature of CRC DataProtection Enterprise Backup & Recovery
- Virtually unlimited granularity provides a much more efficient backup option
- Reduce complexity and costs for IT administrators
- Optimized for WAN with features like de-duplication, delta blocking, data compression, block-level incremental processing and incremental forever backup
- AES 256 encryption on data sent from any remote site to CRC's data center

## Minimize exposure and shorten recovery time

The integrated event-based Continuous Data Protection (CDP) component of CRC DataProtection provides continuous, 24/7 support for Recovery Point Objectives as granular as 1 second. CDP is designed for remote backup operations with automatic WAN optimization built-in and support for automatic re-connection and resumption in the event of a connection failure.

CDP effectively creates an electronic journal of complete storage snapshots, one storage snapshot for every instant in time that data modification occurs, for minimization of Recovery Point Objectives and thus minimal business impact from disasters.

The CDP feature continuously monitors your data for changes and will preserve copies of all prior versions of any given data. You'll have the ability to view and access these prior versions as required, and the time to perform recovery changes from hours or days to seconds or minutes. With CDP, the backup window is no longer a problem- because there is no longer the concept of a backup window.

CRC Data Protection adds agentless CDP functionality without charging users any additional licensing. CRC DataProtection pricing is based on a 'pay as you grow' model where users only pay for the actual amount of compressed data stored in CRC's online Vault.

---

## The Next Step

Continuous Data Protection is currently available as part of the CRC DataProtection remote backup software. Existing CRC DataProtection customers can add CDP functionality at no cost.

Test drive CRC DataProtection CDP Technology with a free 30 day trial. To get started, call **1-800-650-2679** or contact: **sales@crcsecure.com**

## About CRC DataProtection

Every day more than 800 companies rely on CRCDataProtection to safeguard their critical business data. With more than two decades of experience in information management and security, we are experts in mission-critical data operations.

CRC partners with Asigra, Dell, Cisco, Verizon, NetSec, Microsoft, and many other leading suppliers of computer hardware and software to ensure safe, secure, and robust tools on which to build its data protection platform. All data is synchronized between two fully-redundant secured data centers in real time via Cisco® Secure Virtual Private Network, and invest regularly in comprehensive security assessments and ongoing protection with NetSec®. Redundant PIX® firewalls and intrusion detection systems further safeguard the integrity of all data.
