

Message-Level Restore (MLR)

Save time and resources with selective restore capabilities and a streamlined process

Key Benefits

- Protect and restore individual or group e-mails without interrupting e-mail server
- Selective filtering- restore only specific mailboxes or e-mails instead of the entire database
- Streamline restoration process with easy recovery to any hardware at any location
- Bare-metal restore feature allows for recovery of email and other data without OS reinstalls or hardware reconfigurations.

Company-wide email protection

E-mail is the most widely used communications tool for many companies, and consequently any lost or corrupted emails can negatively affect your business. CRC DataProtection offers Message Level Restore (MLR) for Microsoft Exchange, Microsoft Outlook, Lotus Notes/Domino and Novell GroupWise users to protect and restore individual or group emails, at the mailbox level, without interrupting the email server.

The Message Level Restore (MLR) module, part of CRC's agentless, multi-site backup and recovery software, allows users to selectively back up and restore individual mailboxes and email messages for one user or for an entire network, depending on needs. Using MLR's selective filtering, administrators can save time, money and resources by restoring only selected mailboxes or emails, instead of having to restore the entire Exchange, Domino or GroupWise databases.

With MLR, restoring lost, damaged or corrupted messages becomes a quick and streamlined process, allowing easy recovery to any existing hardware at any location. CRC DataProtection also enables bare metal restores, allowing administrators to recover any data, including email, to bare-metal systems, without having to manually reinstall operating systems or configure hardware prior to email restore processes. Unlike other legacy agent-based backup software vendors, this bare metal restore functionality is available at no additional cost thanks to CRC's compressed capacity-based licensing model.

About CRC DataProtection

Every day more than 800 companies rely on CRC Data Protection to safeguard their critical business data. With more than two decades of experience in information management and security, we are experts in mission-critical data operations.

CRC partners with Asigra, Dell, Cisco, Verizon, NetSec, Microsoft, and many other leading suppliers of computer hardware and software to ensure safe, secure, and robust tools on which to build its data protection platform. All data is synchronized between two fully-redundant secured data centers in real time via Cisco® Secure Virtual Private Network, and invest regularly in comprehensive security assessments and ongoing protection with NetSec®. Redundant PIX® firewalls and intrusion detection systems further safeguard the integrity of all data.
